Crowdsourced Civic Issue Reporting and Resolution System

DILLI BABU(192319038)
PERARASAN(192521404)
Kumaravel(192319019)

Introduction

citizens face many civic problems in their daily life.
But the main problem is that there is no simple and transparent way to report and track these issues.
So, our system connects citizens and civic authorities through a single digital platform.
Citizens can report an issue with a photo and location, and authorities can track and resolve it.

Problem Statement

We identified four major problems in the existing system.

- First, there is no centralized complaint channel.
- Second, citizens don't have proper visibility of complaint status.
- Third, complaints may be delayed because there is no proper department assignment.
- Fourth, authorities don't have enough data to analyze recurring civic problems.”

Objectives

The main objective of our project is to make civic complaint management faster, transparent and accountable.

Citizens can easily report issues.

Complaints can be routed to the correct department.

Citizens can track the status.

Authorities can use analytics for better decision making.

We also provide resolution proof before closing the complaint

Existing vs Proposed

In the existing system, complaints are mainly handled through phone calls, physical visits or informal communication.

There may be no photo evidence, no proper location information and no complaint tracking.

In our proposed system, the citizen can report the issue online with photo and location.

The complaint is assigned to the responsible department and the citizen can track its progress

Architecture

Our system has three main layers.

- The first is the **Presentation Layer**, which contains HTML, CSS and JavaScript.
- The second is the **Application Layer**, where Python Flask handles the backend logic.
- The third is the **Data Layer**, where complaint and user information is stored in MySQL.
- We also use map functionality to capture and display complaint locations

Citizen Module

This is the Citizen Module.

A citizen can register and login.

After login, the citizen can report a civic issue by selecting the category, entering a description, uploading a photo and providing the location.

After submitting, the citizen can track the complaint status and view the complaint history

Authority Module

This is the Authority or Admin Module.

Authorities can view the complaints and filter them based on category, location and priority.

The administrator can assign the complaint to the appropriate department.

The department can update the complaint status and add progress updates.

After solving the issue, they can upload resolution proof.

Process Flow

This is the complete complaint lifecycle.

Step 1: Citizen reports the issue with photo and location.

Step 2: The complaint is categorized.

Step 3: It is assigned to the relevant department.

Step 4: The department starts the work and changes the status to In Progress.

Step 5: After completing the work, resolution proof is uploaded and the complaint is marked as Resolved.

Database

- Our database stores the important information required for the system.
- The Users table stores citizen and authority details.
- The Complaints table stores complaint information such as category, description, photo, location and status.
- The Departments table stores department details.
- The Resolution Log stores assignment and resolution information.
- These tables are connected using relationships

Advantages

- The main advantages of our system are faster complaint resolution, transparency and accountability.
- Citizens can track their complaints.
- Authorities can manage complaints systematically.
- Analytics helps authorities understand recurring problems.
- Resolution proof provides additional accountability

Future Scope

- In the future, we can improve this system using AI-based image classification.
- We can also add multilingual support for regional languages.
- SMS or WhatsApp integration can be added.
- Gamification can encourage citizens to participate.
- Historical data can also be used for predictive maintenance

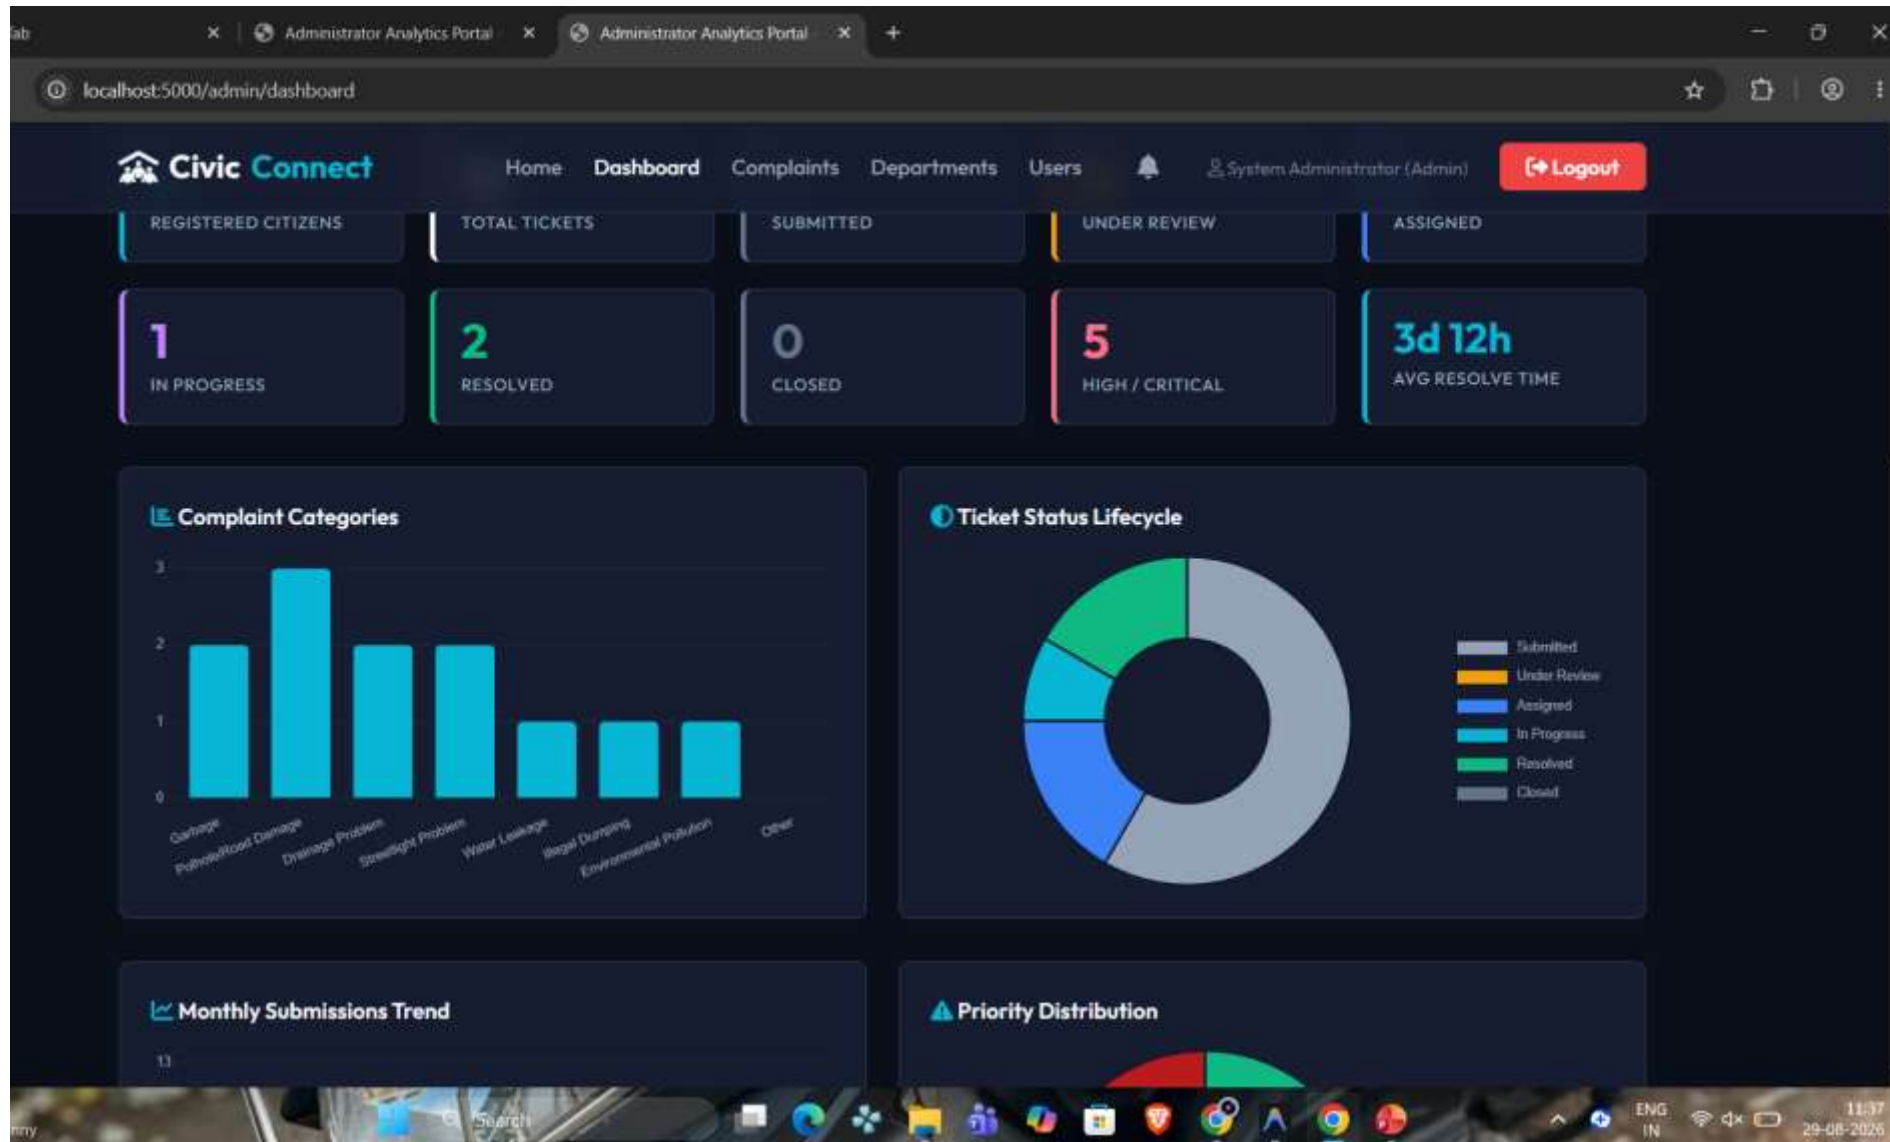

Conclusion

- To conclude, our project provides a digital connection between citizens and authorities.
- It allows citizens to report problems and track their complaints.
- Authorities can assign, monitor and resolve the complaints.
- Resolution proof improves transparency and accountability.
- Overall, our system provides a smarter and more efficient way to manage civic issues
